March 17th, 2022

Dear HL7 Member,

The Clinical Quality Information Work Group has asked me to forward you a set of recommended corrections and modifications to the currently published "HL7 FHIR® Profile: Quality, Release 1 STU Release 4.1 - US Realm". The referenced specification can be found at https://hl7.org/fhir/us/qicore/ (also the permanent location https://hl7.org/fhir/us/qicore/STU4.1.1/).

Since the 4.1 publication of QICore, several issues have been reported and corrected and an updated specification is available in the continuous integration build site. The content of the 4.1 version has been updated in-place for this errata publication to ensure that the updated content is available as the current version, and that the incorrect content cannot be accessed accidentally in the future.

Changes in this errata publication include:

- **FHIR-35873**: Corrected version-independent links to USCore throughout
- **FHIR-35802**: Corrected negation examples and added guidance for usage of valueset-based negation

A complete list of changes included in this errata can also be found in the version history page of the specification: https://hl7.org/fhir/us/qicore/history.html

Sincerely,

Dan Vreeman
HL7 CSDO
